

Have you ever had a heart attack? Are you age 50 or older?

If you answered “yes” to both of these questions, you may be eligible to take part in a national study of an investigational treatment—chelation therapy and vitamin therapy—for *people with heart disease*.

What is chelation therapy?

Chelation therapy is an investigational therapy using an amino acid (EDTA). It is added to the blood through a vein. Some people believe that chelation therapy may help treat heart disease. However, this has not been scientifically proven. This study will seek to find out whether chelation therapy is safe and effective in treating heart disease.

Study-related treatment
will be provided at no cost.
